

Main Problem we are solving:

Corporate legal teams lose 30% of their deal-making time searching for relevant "market" terms across thousands of disparate past contracts. Standard search tools rely on keywords, failing to understand the structural nuances of a deal.

Main Idea:

An AI-powered deal intelligence platform that "reads" a CIM to instantly map the current transaction's DNA. By extracting high-dimensional characteristics—such as capital structure, consideration complexity, and regulatory risk profiles—the software identifies the most legally relevant precedents from the firm's internal database.

→ Feature to attach the email related to a new version / redline to keep track of the context of each changes

Core Feature:

- **Automated Deal Mapping:** Extracts 15+ legal characteristics from unstructured CIMs.
- **Dynamic Precedent Ranking:** Scores past deals based on "Structural Similarity" rather than just industry keywords.
- **Market-Term Benchmarking:** Instantly shows the "median" for indemnification caps or basket sizes (for example) for similar deals in the last 24 months.

Additional Feature:

- Format agnostic
- Redline explainers that translate edits into plain language,
 - vulgarises clauses
 - identify changes in law
 - suggest clauses that need to be changed and make the change
- Negotiation gap trackers,
 - differences in each other's clauses / disagreements
 - primary clauses needed v. what the client wants but is negotiable
- Deal desk dashboards,
 - market clause dashboard to be able to mark unused data (less than definable percentage of use) in a separate place that will be ignored by ai while it is making suggestions
 - dashboard as a summary of all ongoing contracts and negotiations with due dates
 - dashboard from different types of contracts and departments to be able to reuse clauses using ai
- "What-if" concession simulators,
 - disclose clients' needs (non-negotiable section) v. wants (negotiable section)
 - identify what is needed to discuss v. what is already agreed upon
 - suggest how to resolve what is not agreed upon already
 - discuss potential outcomes depending on what is conceded during negotiation
- Contract review assistants,

- have a database with all the precedents automatically converted to md format
 - identify what applies and what doesn't today
 - identify market clauses ? what is used a lot and percentage of use
 - identify missing clauses ; while identifying the percentage of use
 - ensure the mention of everything the client wanted and needed and the respect of all clients' wishes ; identify missing factors
- Clause risk analyzers,
 - identify potentially problematic clauses in contract
 - suggest solutions that respect market clauses and clients' needs and wants
- AI negotiation co-pilots,

Overview

Structura is a collaborative AI-powered deal platform designed for transactional lawyers, private equity teams, and in-house legal departments.

The platform transforms unstructured deal documents—such as LOIs, SPAs, APAs, and disclosure schedules—into structured negotiation intelligence. Instead of manually searching precedent agreements or managing fragmented redline workflows, deal teams gain a centralized workspace that maps transaction terms, benchmarks market positions, and tracks negotiations in real time.

Structura combines:

- AI deal analysis
- collaborative negotiation tooling
- precedent intelligence
- clause benchmarking
- live issue tracking

into a single secure transaction workspace.

Core Problem

Transactional legal teams lose substantial time:

- searching prior deals for relevant precedent language
- comparing negotiated positions across document versions
- explaining legal edits to business stakeholders
- tracking concessions between parties
- benchmarking whether terms are “market”

Traditional document systems and keyword searches fail because they do not understand:

- transaction structure
- clause context
- negotiation dynamics
- deal-specific risk allocation

This results in:

- slower deal cycles
- inconsistent market positions

- duplicated legal work
 - reduced negotiation leverage
-

Solution

Structura converts transaction documents into structured legal intelligence.

The platform analyzes uploaded agreements and extracts high-dimensional deal characteristics to:

- identify structurally similar precedents
- benchmark negotiated terms
- surface negotiation gaps
- explain clause changes in plain language
- track live deal evolution

All parties collaborate within a secure shared deal room.

Target Users

Primary Users

- M&A lawyers
- private equity legal teams
- in-house transactional counsel
- corporate development teams

Secondary Users

- investment banks
 - venture capital firms
 - deal advisory teams
 - paralegals / legal operations
-

MVP Scope (Hackathon Version)

1. Automated Deal Mapping

Description

Upload an LOI, SPA, or APA and automatically extract core transaction characteristics.

AI Extracted Variables

Examples include:

- purchase price structure
- cash vs equity consideration
- earn-outs
- indemnification caps
- basket structures
- working capital adjustments
- survival periods
- exclusivity provisions
- governing law
- regulatory risk indicators
- financing conditions

Output

A structured “Deal DNA” profile summarizing the transaction.

Value

- eliminates manual issue-spotting
 - standardizes deal understanding
 - accelerates precedent identification
-

2. Clause-Level Negotiation Tracker

Description

A collaborative deal room where both parties negotiate directly within transaction documents.

Features

- live redlines
- threaded clause comments
- issue status tracking
- version comparison

- user mentions
- concession history
- “agreed / unresolved / escalated” labels

AI Enhancements

- plain-language redline explanations
- automatic identification of materially changed clauses
- clause risk summaries
- negotiation sentiment detection

Example

“Buyer narrowed the indemnification survival period from 24 months to 12 months, reducing seller post-closing exposure.”

Value

- centralizes negotiations
 - reduces email fragmentation
 - improves transparency across deal teams
-

3. Market-Term Benchmarking

Description

Benchmark negotiated clauses against prior structurally similar deals.

Examples

The platform can show:

- median indemnification cap
- common basket ranges
- standard exclusivity periods
- typical survival timelines
- frequency of financing outs

Comparison Logic

Deals are ranked by:

- transaction structure
- consideration complexity
- industry
- deal size

- risk profile
- jurisdiction
- buyer/seller characteristics

—not merely keyword matching.

Output

“Similar mid-market software acquisitions in the last 24 months used a median indemnification cap of 11%.”

Value

- strengthens negotiation strategy
 - provides market validation
 - accelerates drafting decisions
-

Platform Architecture

Inputs

- PDF
- DOCX
- email exports
- OCR scans
- virtual data room exports

AI Pipeline

1. Document ingestion
2. OCR + parsing
3. Clause segmentation
4. Legal entity extraction
5. Deal structure classification
6. Similarity scoring
7. Benchmark generation

Outputs

- structured deal dashboard
- clause analytics
- benchmark insights

- negotiation tracking
-

Key Differentiator

Most legal AI tools:

- summarize contracts
- search by keywords
- review isolated clauses

Structura focuses on:

Transaction Intelligence

The platform understands:

- how the deal is structured
- which clauses materially matter
- how negotiation positions evolve
- what is market for similar transactions

Structura treats a transaction as a dynamic negotiation system—not merely a static document.

Competitive Positioning

Product Type	Limitation	Structura Advantage
Generic contract AI	Clause-level only	Full transaction context
Traditional DMS	No intelligence layer	AI-powered benchmarking
Closing software	Administrative focus	Negotiation intelligence
Keyword precedent search	Poor structural matching	Similarity-based precedent ranking

Future Features

AI Negotiation Co-Pilot

Suggest fallback language and negotiation strategies based on prior successful deals.

Clause Risk Analyzer

Identify unusually aggressive or non-market provisions.

What-If Concession Simulator

Model negotiation outcomes if a party concedes on specific provisions.

Auto-Generated Issues List

Create a dynamic deal issues tracker directly from document changes.

Deal Analytics Dashboard

Track:

- average negotiation cycle time
 - recurring negotiation bottlenecks
 - clause deviation trends across firms
-

Security & Compliance

- role-based permissions
 - encrypted document storage
 - audit logs
 - document version history
 - granular sharing controls
 - optional on-premise deployment for enterprise clients
-

One-Line Pitch

Structura is an AI-powered deal room that transforms transaction documents into live negotiation intelligence, precedent benchmarking, and collaborative deal analytics.

Hackathon Demo Flow

1. Upload SPA
 2. AI extracts deal structure
 3. Platform identifies similar historical deals
 4. Users negotiate clauses collaboratively
 5. AI explains redlines in plain language
 6. Benchmark panel shows market-standard positions
 7. Dashboard tracks unresolved negotiation points
-

Vision

Structura aims to become the operating system for transactional negotiations—where legal precedent, market intelligence, and live deal collaboration converge into a single AI-native workspace.
